UseLegacyKernelObjectsNames

```
# -----  
# The way of how to create names for named Windows kernel objects, such as  
# events, memory mapped files, etc. Since v4.0.3 Firebird creates its named  
# kernel objects in private namespace. It allows to interact processes within  
# different Windows sessions, such as user session and system session. Also,  
# it uses engine version in some shared event names - it allows single process  
# to host Firebird engines of different versions.  
#  
# The legacy names is for backward compatibility only, it allows simultaneous  
# run of Firebird processes of newly (>= v4.0.3) and older (< 4.0.3)  
# subreleases of version 4.  
#  
# The setting is global.  
# It is used for backward compatibility only and will not be present in the  
# future Firebird versions.
```

```
#  
# Type: boolean  
#  
#UseLegacyKernelObjectsNames = false
```

```
# -----  
# Local Connection Settings  
#  
# The name of the shared memory area used as a transport channel in local protocol.  
# Note that the local protocol in v2.0 is not compatible with any previous version  
# if Firebird or InterBase.  
#  
# Please note that the server can register objects in Global\ kernel namespace  
# only if it runs under the account with SE_CREATE_GLOBAL_NAME privilege.  
# This means that if you run the server under a restricted account under  
# Windows Vista/XP SP2/2000 SP4 it will not be accessible using the  
# local protocol from other sessions.  
#  
# Per-connection configurable.  
#  
# Type: string  
#  
#IpcName = FIREBIRD
```
